Methodology:

In this report, we use the statistical arbitrage strategy to find the historically correlated underlying assets, the profitability of pairs trading is selected by using the co-integration method in China's commodity market over the period of 2017 to 2018.

Note: Darker colors indicate higher correlation/co-integration

After applying the unit root test (in this case, the ADF method is applied) to identify the feasibility of the potential trading pairs, we choose the high-correlated pairs ($\rho > 0.80$) as follows:

Table1: Selected Correlation Matrix

	CU	ZN	HC	RB	NI	PB
CU	1.0000	0.9375	0.8686	0.8621	0.8584	0.7387

We use linear regression to determine the integration equation (in mt).

After standardising the residuals series, we determine the long/short position of each portfolio as follows:
